1. SPENT NUCLEAR FUEL

1.1 INTRODUCTION

This chapter reports both the quantities and characteristics of spent nuclear fuel (SNF) that has been permanently discharged from commercial light-water reactors (LWRs) and one-of-a-kind reactors. In addition, this chapter contains a mass summary report of U.S. Department of Energy (DOE) SNF (see Sect. 1.4). Though currently in storage at numerous commercial and DOE sites, this fuel will ultimately require geologic disposal.

Some commercial SNF in inventory will be reinserted into reactors for further irradiation. However, this amount is relatively small, and the schedules for reinsertions are not always predictable. Therefore, in this report, all SNF is considered to be permanently discharged from the reactors.

Historical inventories of commercial LWR SNF have been updated through December 31, 1995. The data reported in this chapter include the inventories of SNF stored at the West Valley Demonstration Project (WVDP), the Midwest Fuel Recovery Plant (MFRP), the Idaho National Engineering and Environmental Laboratory (INEEL), and other DOE sites in addition to those stored at the various reactor sites. The current locations of existing and planned power reactor sites and commercial LWR SNF storage facilities are given in report DOE/OSTI-8200-R60 (ref. 2).

Projections of nuclear capacity and SNF discharges are given for the calendar years (CYs) 1997–2030 for the DOE/Energy Information Administration (EIA) Reference Case forecast schedule reported in ref. 3. Starting with an estimate for 1997 of 100.7 GW(e), the Reference Case forecast projects installed commercial nuclear electric capacity to start declining in the year 1999, ultimately decreasing to 2.3 GW(e) by 2030.

The Reference Case scenario for projecting accumulated SNF assumes a nuclear fuel cycle that does not have any fuel reprocessing. SNF discharge projections, in terms of cumulative mass discharged, are graphically illustrated in Fig. 1.1.

DOE/EIA projections for the Reference Case assume that current average equilibrium burnup levels of discharged SNF will be 33,000 and 41,000 megawatt day (MWd)/metric tons of initial heavy metal (MTIHM) for boiling-water reactor (BWR) and pressurized-water reactor (PWR) fuel, respectively.³

1.2 COMMERCIAL SPENT NUCLEAR FUEL

1.2.1 Inventories and projections

The total inventory of commercial LWR SNF in storage at the WVDP site, the MFRP, DOE sites, and the reactor sites as of December 31, 1996, is estimated to be over 34,000 MTIHM. Of this total amount, 26 MTIHM are stored at the WVDP site, 4674 MTIHM are stored at the MFRP, 171 MTIHM are stored at INEEL, 4 and about 25 MTIHM are stored at other DOE sites. The remainder is stored at the reactor sites. These inventories do not include the SNF reprocessed at the WVDP site when the facility was operated as a fuel reprocessing plant. The WVDP SNF inventories include 125 LWR fuel assemblies (representing 26 MTIHM), which are owned by DOE.

A BWR/PWR breakdown of the electric power generating capacity for the Reference Case forecast, along with historical reactor capacity data, is given in Table 1.1. The buildups of permanently discharged LWR SNF mass are given on a historical basis in Table 1.2 and for the projected DOE/EIA Reference Case in Table 1.3.

1.2.2 Characterization

Reference characteristics of BWR and PWR fuel assemblies, obtained from refs. 5 and 6, are summarized in Table 1.4. More detailed information on SNF characteristics may be found in ref. 7.

1.3 DISPOSAL

The DOE Office of Civilian Radioactive Waste Management (OCRWM) has been focused on characterization of the Yucca Mountain site to address suitability of the site. The approach has been refined to structure a multi-staged process for arriving at a site suitability determination. This process calls for an assessment to be made in 1998 of the viability of siting a repository at Yucca Mountain and an updating of the regulatory framework for siting a repository. Excavation of the main tunnel of the Exploratory Shaft Facility was completed in April 1997. Extensive surface-based and underground testing are still being conducted.

OCRWM is developing an approach for the performance of its waste acceptance, storage, and transportation responsibilities, as set forth in the Nuclear Waste Policy Act (NWPA), as amended, and in the Standard Contract for disposal of SNF and HLW (see Glossary of Terms). A presolicitation conference was held July 9, 1996, to discuss technical and contractual issues related to the potential acquisition of transportation services. At the presolicitation conference, OCRWM made available a draft Statement of Work and a draft Concept of Operations for the waste acceptance and transportation services acquisition. A draft request for proposals (RFP) was issued for public review and comment in December 1996, followed by another presolicitation conference in March 1997.

OCRWM is pursuing an acquisition process that is market-driven, relying on private industry (contractors) to provide all necessary services and equipment to fulfill OCRWM's mission at competitive fixed prices and fixed rates. The contractors would accept SNF from its owners and generators (purchasers) and supply casks and equipment for transporting SNF to (and possibly storage at) a designated federal facility. Contractors would work with purchasers to determine the best way to service a site and would recommend to the NRC preferred transportation routes to a federal facility.

OCRWM may award up to four contracts, covering four regions of the United States. The intent is to develop a market infrastructure to foster competition and innovative approaches to waste acceptance and transportation.

1.4 DOE SPENT NUCLEAR FUEL

Summary inventory characteristics of DOE SNF as of June 1997 are given in Table 1.5 (based on ref. 4). Projected site inventories for CY 2035 are also included. Figure 1.2 shows the major locations and masses of current DOE SNF inventories.

For clarification, the quantities of SNF reported in Table 1.5 include contributions from other nuclear fuels besides those permanently discharged from production reactors. SNFs reported in this table also include DOEowned nuclear fuel that has been withdrawn from or resides for storage in a nuclear reactor following irradiation, the constituent elements of which have not been separated by processing. In addition to intact fuel, reactor-irradiated fuel materials requiring special handling (e.g., defective fuel and special fuel forms) are also considered SNF and are eligible for inclusion in Table 1.5. This table also lists some commercially generated nuclear fuels and nuclear fuels from foreign research reactors (FRRs) and university research reactors which are stored at DOE sites. More detailed information on these special nuclear fuels will be included in future updates of this report.

Major changes in the DOE SNF inventories reported in Table 1.5 that have occurred since the last publication of this document are attributed to the following:

- SNF at LANL has been moved to SRS;
- SRS has also received shipments of SNF from several universities, non-DOE-owned research reactors, and FRRs;
- Inventories of naval SNF at INEEL have increased, and most SNF that was previously stored at the INEEL ICPP-603 facility has been removed;
- At McClellan Air Force Base, inventories of Training Reactor, Isotopes, General Atomics (TRIGA) fuel have increased; and
- About 167 MTIHM of SNF has been processed at SRS and Argonne National Laboratory–West (ANL–W), and the resulting waste is now listed as high-level waste (HLW).

^aBased on ref. 4. Inventories for 1997 are reported as of June 1997.

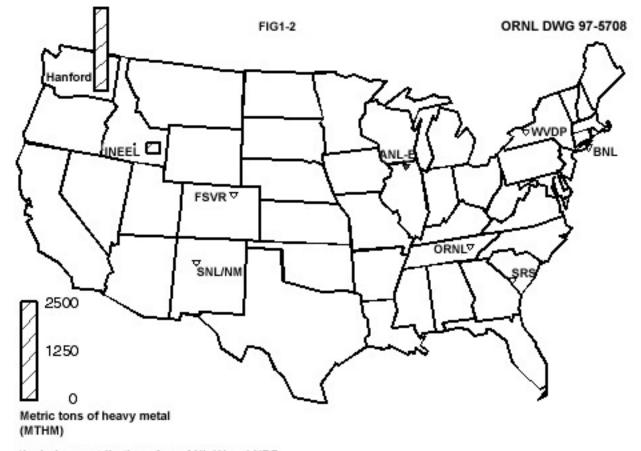

bAbbreviations used in this table: ACRR—Annular Core Research Reactor, ARRR—Aerotest Radiography and Research Reactor, BMRR—Brookhaven Medical Research Reactor, BSR—Bulk Shielding Reactor, CMR—Chemistry and Metallurgical Research, ECF—Extended Core Facility, FCF—Fuel Conditioning Facility, FFTF—Fast Flux Test Facility, FRR—Foreign Research Reactor, FSVR—Fort St. Vrain Reactor, GA—General Atomics, GE—General Electric, HCF—Hot Cell Facility, HFBR—(Brookhaven) High Flux Beam (Research) Reactor, HFEF—Hot Fuel Examination Facility, ICPP—Idaho Chemical Processing Plant, IFSF—Irradiated Fuel Storage Facility, ISA—Interim Storage Area, ISFSI—Independent Spent Fuel Storage Installation, MNRC—McClellan Nuclear Radiation Center, MSR—Molten Salt Reactor, MTR—Materials Test Reactor, NBSR—National Bureau of Standards Reactor, PER—(Special) Power Excursion Reactor (Test), PFP—plutonium finishing plant, RBOF—Receiving Basin for Off-Site Fuels, RSWF—Radioactive Scrap and Waste Facility, SRTC—Savannah River Technical Center, TAN—Test Area North, TRA—Test Reactor Area, TREAT—Transient Reactor Test Facility, TRIGA—Training Reactor, Isotopes, General Atomic, TSR—Tower Shielding Reactor, USGS—U.S. Geological Survey, and VA—Veterans Administration.

^cIncludes reactors at both Columbia and Rolla.

ORNL DWG 98-3532R

^{*}Includes contributions from ANL-W and NRF.

Note. Only locations are shown for sites whose DOE SNF inventories are less than 50 MTHM. Excludes fuel at universities & non-DOE-owned domestic reactors.
